Paper 2 Structured Questions

25 August 2022

2 hours

Candidates answer on the Question Paper.

Additional Materials: Data Booklet

READ THESE INSTRUCTIONS FIRST

Write your Centre number, index number and name in the spaces at the top of this page.
 Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

Answer all the questions in the spaces provided on the Question Paper.

The use of an approved scientific calculator is expected, where appropriate.

The number of marks is given in brackets [] at the end of each question or part question.

For Examiner's Use		
Paper 1		/30
Paper 2	Q1	/9
	Q2	/14
	Q3	/10
	Q4	/8
	Q5	/20
	Q6	/14
	Total	/75
Paper 3		/80
TOTAL (%)		/100

This document consists of 23 printed pages and 1 blank page.

Answer all the questions in the space provided.

- 1 (a) Element W is from Period 5 of the Periodic Table. The first eight ionisation energies of element W, in kJ mol^{-1} , are

869 1800 2690 3610 5720 6670 12000 13800

- (i) Identify element W and explain your answer.

.....
.....
.....
.....
.....
.....
.....
..... [2]

- (ii) Explain the difference between the first ionisation energy of element W compared to the element to its left on the Periodic Table.

.....
.....
.....
.....
.....
.....
.....
..... [2]

- (b) The chlorides of elements in Period 3 of the Periodic Table show different behaviours on addition to water.

- (i) Describe and explain the reactions of aluminium chloride, AlCl_3 , and phosphorus pentachloride, PCl_5 , with excess water.

Write equations for any reactions that occur.

[2]

- [3]

- (ii) The reaction of PCl_5 with limited amount of water involves step-wise substitution of $-\text{Cl}$ with $-\text{OH}$.

Write the overall balanced equation for the reaction of PCl_5 with limited amount of water. Hence, suggest a three-step reaction sequence for this reaction.

Overall equation: + + = + +

Step 1:
.....

Step 2:

Step 3:

[2]

[Total]: 91

- 2 Boron trifluoride, BF_3 , and aluminium fluoride, AlF_3 , differ markedly in their physical properties.

compound	melting point / °C
BF_3	-127
AlF_3	1291

- (a) (i) State the type of bonding present in each of these compounds and draw 'dot-and-cross' diagrams in the boxes below to illustrate this bonding.

Type of bonding:	Type of bonding:
BF_3	AlF_3

[2]

- (ii) Outline the principles of the Valence Shell Electron Pair Repulsion theory.

.....

 [2]

- (iii) Boron trifluoride forms a compound with ammonia.

Use the Valence Shell Electron Pair Repulsion theory to predict and draw the likely shape of the product formed from this reaction.

Shape of product:

[2]

Cyclobutane is an example of a cyclic alkane. While itself has no commercial or biological significance, more complex derivatives of cyclobutane are important in biology and biotechnology.

Cyclobutane decomposes to ethene as shown by the following equation.

A student planned to determine $\Delta H_{\text{decomp}}^{\ominus}$ by using the standard enthalpy changes of combustion of cyclobutane and ethene, represented by ΔH_c^{\ominus} (cyclobutane) and ΔH_c^{\ominus} (ethene) respectively. Both substances are gases at 298 K.

ΔH_c^{\ominus} (ethene) was previously determined to be $-1411 \text{ kJ mol}^{-1}$ in a flame calorimetric experiment.

To determine ΔH_c^{\ominus} (cyclobutane), the student decided to conduct another flame calorimetric experiment under the same conditions.

There are two stages to this experiment.

Stage I : Calibration of calorimeter (i.e. copper can, water and other components in the calorimeter)

In the experiment, the calorimeter must first be calibrated by determining its heat capacity, C, which is the amount of heat required to raise the temperature of the calorimeter by 1 K.

Stage II : Determination of ΔH_c^{\ominus} (cyclobutane) using the calibrated calorimeter.

The student carried out the flame calorimetric experiment using the calorimeter. Part of his results is shown below.

Stage I, using ethene as the fuel,

- change in temperature of water = $33.8 \text{ }^{\circ}\text{C}$
- mass of gaseous ethene burnt = 1.00 g

Stage II, using cyclobutane as the fuel,

- change in temperature of water = $32.9 \text{ }^{\circ}\text{C}$
- mass of gaseous cyclobutane burnt = 1.00 g

- (b) (i)** Use the above information and experimental results to calculate the heat capacity, C, of the calorimeter.

[2]

7

DO NOT WRITE IN THIS MARGIN

- (ii) Use your answer to (b)(i) to determine ΔH_c^\ominus (cyclobutane).

[2]

- (iii) Hence, calculate the standard enthalpy change of decomposition of cyclobutane to ethene, $\Delta H_{\text{decomp}}^\ominus$.

[1]

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

- (c) (i) Use data from the *Data Booklet* and the $\Delta H_{\text{decomp}}^\ominus$ obtained in (b)(iii) to calculate the actual C–C bond energy in cyclobutane.

[You may assume that the difference between the C–H bond energy in cyclobutane and in ethene, and the difference between the C=C bond energy from the *Data Booklet* and in ethene are insignificant.]

[2]

- (ii) Suggest an explanation for the difference between the average C–C bond energy from the *Data Booklet* and the actual value calculated in (c)(i).

.....

[Total: 14]

- 3 (a) SO₂ gas is found in air near volcanoes. 213 cm³ of SO₂ collected at r.t.p. near a volcano required 25.0 cm³ of 0.120 mol dm⁻³ acidified potassium dichromate(VI) solution for complete reaction.

Calculate the final oxidation state of sulfur in the product mixture.

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

[2]

- (b) The Contact process is an important industrial method of manufacturing sulfuric acid. The key stage of the Contact process is the reaction between sulfur dioxide and oxygen:

Table 3.1 shows how the percentage of sulfur trioxide in the equilibrium mixtures varies with temperature as well as the volume of the reaction vessels.

Table 3.1

Temperature /°C	Percentage of sulfur trioxide in the equilibrium mixture for vessel		
	A	B	C
800	1.68	0.009	0.88
700	2.98	0.016	1.54
600	5.70	0.032	3.02
500	11.9	0.077	6.71

Using the data in Table 3.1,

- (i) explain whether the forward reaction is exothermic or endothermic.

.....

 [2]

- (ii) explain and rank the three vessels in order of decreasing volume.

.....

 [2]

A mixture containing 2 moles of SO_2 and 1 mole of O_2 was heated in a closed 3.60 dm^3 flask at 500°C and allowed to reach equilibrium. The flask was then rapidly cooled to liquefy SO_3 .

After removing gaseous SO_2 and O_2 , excess water was carefully added to the liquid SO_3 , causing the following reaction to occur:

The resulting solution was made up to 250 cm^3 in a standard volumetric flask. 25.0 cm^3 of this solution was titrated with 5.00 mol dm^{-3} NaOH and required 38.50 cm^3 for complete neutralisation.

- (iii) Calculate the equilibrium amount of SO_3 at 500°C .

10

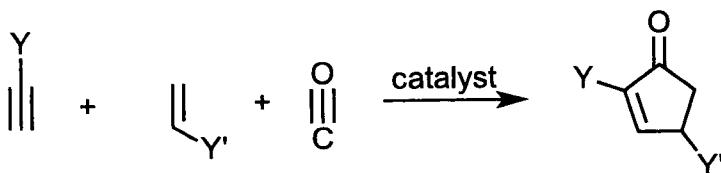

DO NOT WRITE IN THIS MARGIN

- (iv) Hence, calculate a value for the equilibrium constant, K_c , of equation 1.

[2]

[Total: 10]

- 4 (a) The Pauson-Khand reaction is a gas phase reaction between an alkyne, an alkene and carbon monoxide to form a cyclic carbonyl compound, as shown in Fig. 4.1.

where Y and Y' can be Cl or H.

Fig. 4.1

An organic compound **A** was produced from the Pauson-Khand reaction. The compound has the following composition by mass; 51.5 % C, 13.7% O, 30.5% Cl and 4.3% H. The relative molecular mass of **A** is 116.5.

Upon heating with ethanolic AgNO_3 , **A** gave a white precipitate.

- (i) Determine the molecular formula of **A** and draw its structural formula.

DO NOT WRITE IN THIS MARGIN

[2]

11

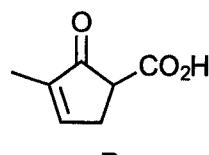

DO NOT WRITE IN THIS MARGIN

- (ii) Draw a diagram to show the orbitals of the carbonyl carbon in compound A. State the type of hybridisation involved.

Type of hybridisation:

[1]

- (b) Another possible product of the Pauson-Khand reaction is shown below:

**B**

Draw the organic product formed when **B** reacts with each of the following.

- (i) cold KMnO₄(aq) in KOH(aq)

DO NOT WRITE IN THIS MARGIN

- (ii) LiAlH₄

[2]

- (c) A flask with a volume of 100 cm^3 was first weighed with air filling the flask, and then with another gas Z, filling the flask. The results, measured at 26°C and $1.00 \times 10^5 \text{ Pa}$ are shown.

Mass of flask containing air	= 47.930 g
Mass of flask containing Z	= 47.989 g
Density of air	= $0.00118 \text{ g cm}^{-3}$

Calculate the relative molecular mass of Z.

DO NOT WRITE IN THIS MARGIN

[3]

[Total:8]

DO NOT WRITE IN THIS MARGIN

- 5 (a) The 'bromine clock' involves a reaction between bromide ions and bromate(V) ions in acid solution:

The reaction can be monitored by adding phenol and a constant volume of methyl red to all the experiments.

Phenol reacts immediately with the bromine as it is produced. Once all the phenol added has reacted, the bromine that is subsequently produced will oxidise the methyl red causing the disappearance of the red colour in the reaction mixture.

A series of experiments were carried out to investigate the order of reaction with respect to $[\text{BrO}_3^-]$ and the results obtained are shown in Table 5.1.

Table 5.1

Expt	Volume of BrO_3^- / cm ³	Volume of Br^- / cm ³	Volume of H^+ / cm ³	Volume of phenol / cm ³	Volume of deionised water / cm ³	Time taken for the colour of methyl red to disappear / s
1	5.0	5.0	10.0	1.0	11.0	82
2	10.0	5.0	10.0	1.0	6.0	42
3	10.0	5.0	10.0	2.0	5.0	x

- (i) Write an equation for the reaction between phenol and bromine water.

[1]

- (ii) Deduce the order of reaction with respect to $[\text{BrO}_3^-]$. Explain your reasoning.

.....

.....

.....

.....

.....

.....

.....

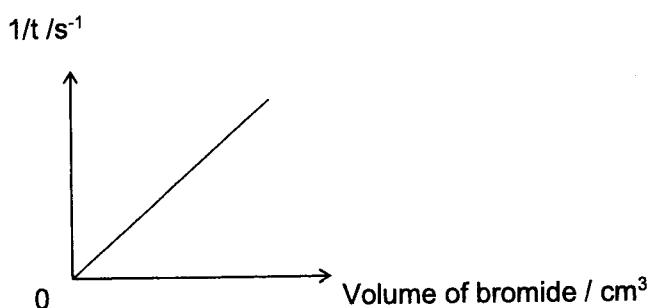

[1]

- (iii) Using your answer in (a)(ii), calculate the value of x.

.....

 [1]

- (iv) Another series of experiments were conducted with varying volumes of bromide ions and large excess of BrO_3^- and H^+ . The total volume of the mixture was kept constant. The results obtained were used to plot a graph of $1/t$ against the volume of bromide.

Deduce the order with respect to $[\text{Br}^-]$, explain your reasoning.

.....

 [1]

- (v) Given that the unit of the rate constant is $\text{mol}^{-3} \text{ dm}^9 \text{ s}^{-1}$, deduce the order with respect to $[\text{H}^+]$.

.....

 [1]

- (b) The reaction between $\text{S}_2\text{O}_8^{2-}$ and tartrate ions is catalysed by iron(III) ions and the overall equation is as shown.

Write equations to illustrate how iron(III) ions catalyses the reaction.

[2]

- (c) Methyl red is a pH indicator. It is red when the pH is less than 4.4 and yellow when the pH is above 6.2.

In microbiology, methyl red is used to identify bacteria that produces acids from the metabolism of glucose. The type of acid produced depends on the specific enzymatic pathways present in the bacteria.

All the bacteria initially metabolise glucose to pyruvic acid, $\text{CH}_3\text{COCO}_2\text{H}$. After which, some bacteria use the mixed acid pathway to metabolise pyruvic acid while other bacteria use the butanediol fermentation pathway. The products formed and the colour of methyl red are shown in Table 5.2.

Table 5.2

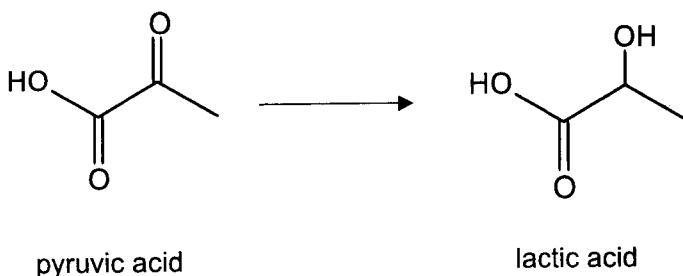

Metabolism pathway	Products formed per mole of glucose	Colour of methyl red
Mixed acid pathway	4 mol of acids (mainly lactic acid, $\text{CH}_3\text{CH}(\text{OH})\text{CO}_2\text{H}$, and ethanoic acid), 1 mol of ethanol, 1 mol of CO_2 1 mol of H_2	Red
Butanediol fermentation pathway	1 mol of acid	Yellow

- (i) Explain the colours of methyl red shown in Table 5.2.

.....

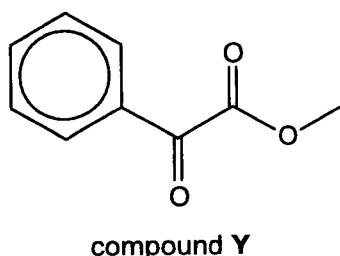

[1]

- (ii) State the reagent and condition to obtain lactic acid from pyruvic acid.

Reagent and condition: [1]

- (iii) Suggest the reagents and conditions, including the structures of the intermediates, for the synthesis of compound Y from pyruvic acid.

- (d) Table 5.3 shows the pK_a values of some compounds, including phenol.

Table 5.3

Compound	pK _a
Phenol	10.0
Phenylmethanol, C ₆ H ₅ CH ₂ OH	15.4
Phenylmethanethiol, C ₆ H ₅ CH ₂ SH	9.93

- (i) Suggest how the acidities of phenol and phenylmethanol compare with each other.

[2]

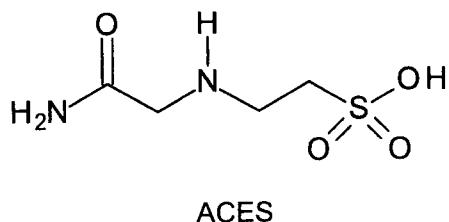

..[2]

- (ii) Suggest a reason why the pK_a for $C_6H_5CH_2SH$ is much lower than that for $C_6H_5CH_2OH$.

[1]

- [1]

- (e) ACES, $C_4H_{10}N_2O_4S$, is another compound containing sulfur.

ACES

ACES has a pK_a value of 6.88.

- (i) Draw the structure of the product formed when dilute hydrochloric acid is added to ACES at room temperature.

[1]

- (ii) Draw the structure of the conjugate base of ACES.

[1]

- (iii) The pH of a solution of ACES is 2.2.

Calculate the ratio of [conjugate base of ACES] to [ACES].

DO NOT WRITE IN THIS MARGIN

[1]

19

DO NOT WRITE IN THIS MARGIN

- (iv) 0.0200 mol of the conjugate base of ACES is dissolved in 100 cm³ of deionised water. 50 cm³ of 0.300 mol dm⁻³ of hydrochloric acid was added to the solution.

Given that the conjugate base reacts with hydrochloric acid in a 1:1 stoichiometry, calculate the pH of the solution.

[Total: 20]

- 6 The Gabriel synthesis is a 3-step approach to synthesis amines. Phthalimide is used as the main reactant, which has a nitrogen atom flanked by two carbonyl groups.

Propylamine is obtained from the Gabriel synthesis method as shown in Fig. 6.1.

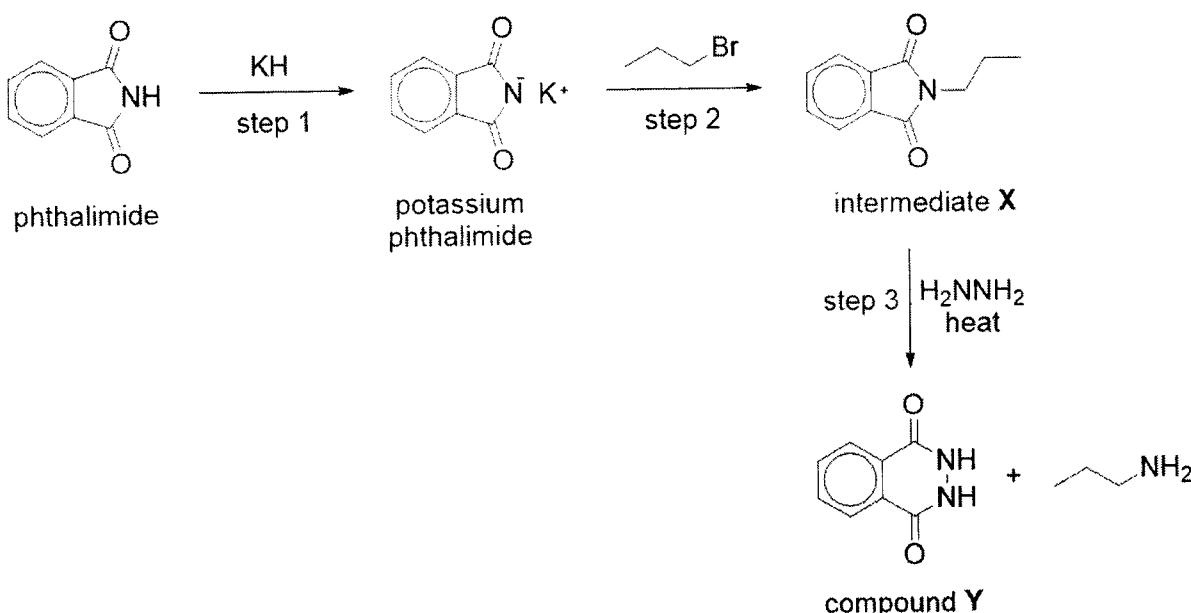

Fig. 6.1

- (a) (i) State the role of phthalimide in the above reaction in step 1.

..... [1]

- (ii) With reference to the product formed in step 1, explain why phthalimide is able to function as the role identified in (a)(i).

.....
.....
.....
..... [1]

21

DO NOT WRITE IN THIS MARGIN

- (b) Step 2 of Gabriel synthesis is a nucleophilic substitution reaction.

With reference to the structures of relevant reactants, explain why potassium phthalimide does not react with 2-bromo-2-methylpropane at all.

.....
.....
.....
.....
.....
.....
.....

[2]

- (c) Suggest another reagent and condition used to liberate the free amine from intermediate X in the last step.

Construct a balanced equation for this reaction, showing the structures of all reactants and products.

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

[2]

- (d) A sample contains both propylamine and compound Y after the Gabriel synthesis shown in Fig. 6.1. A student decides to purify propylamine from the impure sample and starts by adding an equal volume of dilute hydrochloric acid, with stirring, to the sample.

Some physical data for various compounds are given in Table 6.1.

Table 6.1

	propylamine	water	compound Y
Density / g cm ⁻³	0.719	1.0	1.3
Boiling point / °C	47.8	100.0	523.5

- (i) With reference to structure and bonding, explain the purpose of the addition of dilute hydrochloric acid in the purification process.

[3]

..[3]

- (ii) Starting with the mixture from (d)(i), plan an experiment to purify propylamine from the impure mixture.

Your plan should include details of:

- how propylamine is obtained in its anhydrous liquid form; and
 - suitable apparatus used.

Paper 3 Free Response

14 September 2022

2 hours

Candidates answer on the Question Paper.

Additional Materials: Data Booklet

READ THESE INSTRUCTIONS FIRST

Do **NOT** open this booklet until you are told to do so.

Write your name, civics class, centre number and index number on all the work you hand in.
 Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.
 Do not use staples, paper clips, glue or correction fluid.

Section A

Answer **all** questions.

Section B

Answer **one** question.

A Data Booklet is provided.

The use of an approved scientific calculator is expected, where appropriate.

The number of marks is given in brackets [] at the end of each question or part question

For Examiner's Use		
Paper 3	Q1	/18
	Q2	/20
	Q3	/22
	Q4	/20
	Q5	/20
	Total	/80

This document consists of **28** printed pages.

Section A

Answer all the questions in this section.

- 1 (a) Iodolactonisation reaction was first reported by M. J. Bougalt in 1904 and has since become one of the most effective ways to synthesise lactones.

An example of the iodolactonisation is the reaction of 4-pentenoic acid as shown in Fig 1.1.

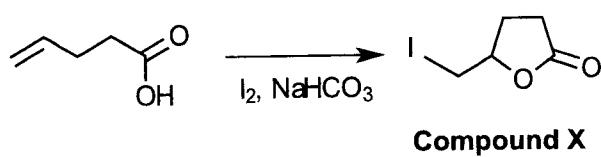

Fig 1.1

Two simplified steps in the iodolactonisation mechanism are given in Fig 1.2.

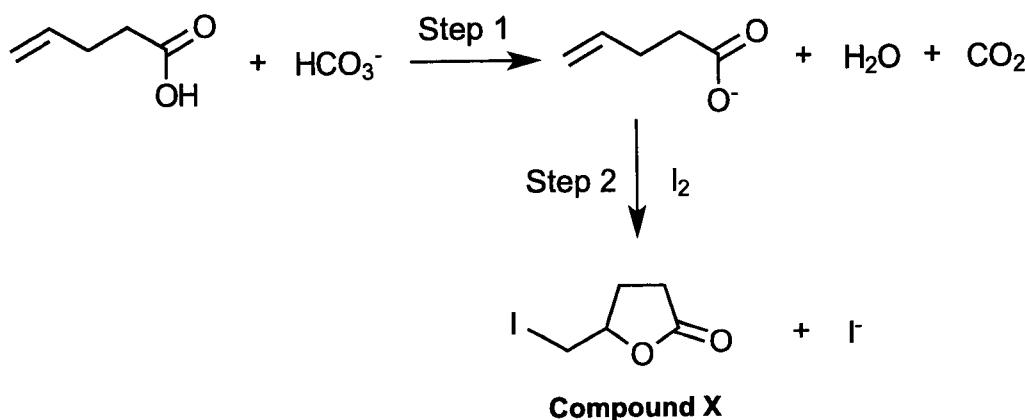

Fig 1.2

- (i) Suggest the role of HCO_3^- in **step 1**. [1]
- (ii) Suggest the mechanism for reaction taking place in **step 2**. Show all charges and relevant lone pairs and show the movement of electron pairs by using curly arrows. [3]
- (iii) Sketch a well-labelled reaction pathway diagram for the reaction in **step 2**, given that the reaction is exothermic. [2]
- (iv) Suggest the structural formulae of the final organic product formed when $\text{CH}_2=\text{CHCH}(\text{CH}_3)\text{CH}_2\text{CH}_2\text{COOH}$ undergoes iodolactonisation in a similar process in Fig 1.1. [1]

- (b) Carbon monoxide is one of the most widespread and dangerous industrial hazards. The formation of carboxyhaemoglobin, $\text{Hb}(\text{CO})_4$, takes place much more readily than the formation of oxyhaemoglobin, $\text{Hb}(\text{O}_2)_4$.

A treatment method for carbon monoxide poisoning is to provide the patient with pure oxygen gas over a period of time.

With reference to the equations given above, explain why this is a suitable treatment [2]

.....

.....

.....

.....

.....

.....

.....

.....

- (c) The water-gas shift reaction is used to produce hydrogen gas industrially by reacting carbon monoxide with water vapour.

An evacuated tank was initially filled with 0.0197 atm of CO and 0.0394 atm of H_2O at 600 K. It was sealed and left to stand. At equilibrium, the partial pressure of CO_2 was found to be 0.0191 atm.

- (i) Calculate the value of K_p at 600 K.

[2]

Table 1.1 shows how the value of K_p varies with temperature.

Table 1.1

T / K	300	900	1500
value of K_p	1.170×10^5	1.978	0.2195

- (ii) The Gibbs free energy, ΔG^\ominus (in J mol⁻¹), and the equilibrium constant, K_p , of a reaction are related by the following equation:

$$\Delta G^\ominus = -RT \ln K_p,$$

where R is the molar gas constant and T is the temperature in Kelvins.

Using the given values of K_p , calculate the values of ΔG^\ominus at 300 K and 900 K. Hence, determine the value of ΔS^\ominus for the water-gas shift reaction.

(Assume that both ΔH^\ominus and ΔS^\ominus are independent of temperature.) [3]

- (iii) Comment on the magnitude of the calculated value of ΔS^\ominus . [1]

- (iv) With the aid of a sketch of the Boltzmann distribution, explain how an increase in temperature affects the rate of water-gas shift reaction. [3]

- 2 Copper is a typical transition element with more than one oxidation state. Many of its compounds have colours in the blue-green-yellow part of the visible spectrum.

The following reaction scheme shows the chemistry of some copper-containing species.

- (a) (i) A and B are both compounds of copper and oxygen only.

Cu_2SO_4 can be made from B under certain anhydrous conditions. The oxidation number of copper in B is the same as in Cu_2SO_4 .

Identify gas G, and write the formula of the copper-containing species in A to C. [2]

- (ii) Suggest, with reason, the colour of solid F. [2]

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

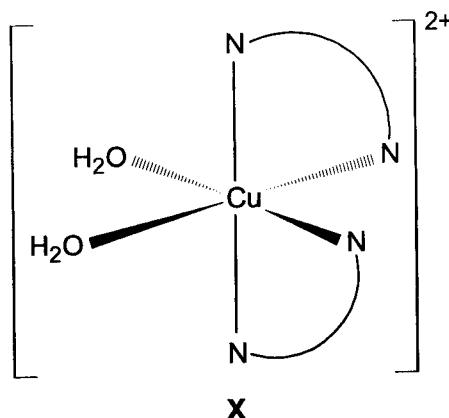

- (b) Explain the transformations from C to E in terms of the competing equilibria and the type of reaction that has occurred. Include equations and the formulae of all copper-containing species.

[4]

- (c) Like many organic compounds, transition metal complexes also exhibit stereoisomerism, namely *cis-trans* isomerism and enantiomerism.

For example, $[\text{Cu}(\text{en})_2(\text{H}_2\text{O})_2]^{2+}$, the complex ion present in H, has three stereoisomers, X, Y and Z. One of these stereoisomers, X, is shown below.

(N N represents the en ligand.)

X and Z are *cis-trans* isomers, while Y is an enantiomer of X.

Draw and label clearly the three-dimensional diagrams of Y and Z. You should use

N N to represent the en ligand.

DO NOT WRITE IN THIS MARGIN

- (d) Selective precipitation is a technique of separating ions in an aqueous solution by using a reagent that precipitates one or more of the ions, while leaving other ions in solution. In the case of Cu^{2+} ions, the separation is achieved by adjusting the pH so that only Cu^{2+} ions are precipitated.

In an experiment, a student adds sodium hydroxide gradually to a solution containing $0.100 \text{ mol dm}^{-3}$ Cu^{2+} ions and $0.100 \text{ mol dm}^{-3}$ Fe^{2+} ions.

Relevant K_{sp} values are given in Table 2.1.

Table 2.1

metal hydroxide	$K_{\text{sp}} / \text{mol}^3 \text{dm}^{-9}$
$\text{Cu}(\text{OH})_2$	2.2×10^{-20}
$\text{Fe}(\text{OH})_2$	8.0×10^{-16}

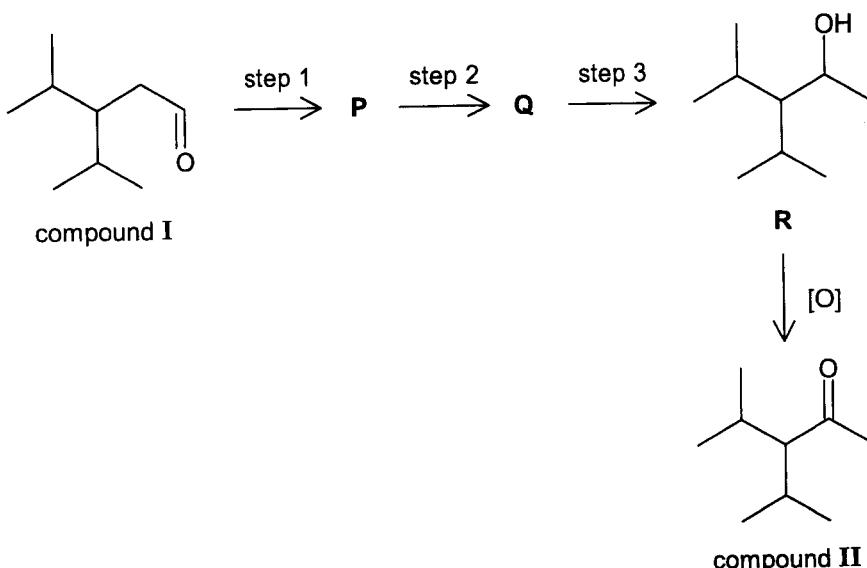

Determine the pH at which maximum separation of the two cations is achieved.

[2]

10

- 3 (a) The reaction of SiBr_4 with moist ethoxyethane produces two oxybromides with the formula $\text{Si}_3\text{O}_2\text{Br}_8$ ($M_r = 755.5$) and Si_2OBr_6 ($M_r = 551.6$).

When 0.192 g of one of the oxybromides reacts with excess water, all the bromine atoms are converted to bromide ions. Excess silver nitrate is added and 0.392 g of cream precipitate is obtained.

- Determine, with the aid of calculations, the identity of the oxybromide which reacted with excess water. [2]
- The cream precipitate was only sparingly soluble in excess aqueous ammonia. However, on addition of aqueous sodium cyanide, the precipitate completely dissolves.

The numerical values of the stability constant, K_{stab} , for the relevant complex ions are given below.

Complex	Stability constant / K_{stab}
$[\text{Ag}(\text{NH}_3)_2]^+$	1.7×10^7
$[\text{Ag}(\text{CN})_2]^-$	1.0×10^{21}

With reference to the table above, briefly explain the observations above as fully as you can. [3]

- (b) Polypeptide chain Y has a sequence of 8 α -amino acids. 2 enzymes, E1 and E2, are added to separate samples of Y and the following fragments are obtained.

Fragments after reaction with E1	Fragments after reaction with E2
val-gln-phe	cys-phe-val
cys-phe	gln-lys-asp
gln-lys-asp	gln-phe

E1 hydrolyse the peptide bond at the carboxylic acid end of phenylalanine (phe) while E2 hydrolyse the peptide bond at the amino end of glutamine (gln).

- (i) Under specific conditions, the dipeptide cys-phe exists as a zwitterion. Explain
- the term "zwitterion"; and
 - one physical property of the cys-phe dipeptide to support its existence as a [2] zwitterion.

The table below shows the R group of some α -amino acids and the pK_a values of respective functional groups.

Amino acid	Structure of R-group	pK_a of α -amino group	pK_a of α -carboxylic group	pK_a of R group
cys	-CH ₂ SH	10.28	1.91	8.14
phe	-CH ₂ -C ₆ H ₅	9.09	2.18	-

- (ii) Draw the zwitterion of cys-phe and determine a pH at which the cys-phe exists as a zwitterion as the predominant species. [2]
- (iii) Deduce the sequence of the amino acids in polypeptide chain Y. [2]

Compound **A** is formed from the electrolysis from α -amino acids in methanol solvent,

compound **A**

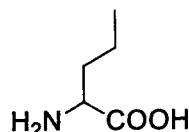

where R is alkyl, R_1 is alkyl or hydrogen and PG is the protecting group, $\text{CH}_3-\text{C}(=\text{O})-$.

The α -amino acids are first converted to its protected form, followed by reaction with sodium hydroxide to form an intermediate, **B**.

At the anode, the anion in intermediate **B** undergoes decarboxylation to form cation **C**. No other reactions occur at the anode.

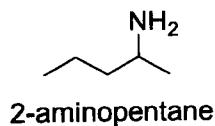

Norvaline is an α -amino acid which is used in dietary supplement for bodybuilding. It undergoes the electrolysis reaction above.

norvaline

- (c) State the reagent and condition to convert norvaline to its protected form. [1]

-
- (d) Compound **A** undergoes hydrolysis to form amine **X**.
- (i) Draw the structure of amine **X**, when norvaline undergoes the electrolysis reaction above, followed by hydrolysis. [1]
- (ii) Explain the difference in basicity of amine **X** and 2-aminopentane. [2]

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

- (e) Cation **C** subsequently reacts with methanol, which acts as a nucleophile, to give **A** in 2 steps.

Step 1: methanol attacks the electron deficient carbon in cation **C**, to form another cation intermediate.

Step 2: the intermediate undergoes deprotonation to give **A**.

Starting with the appropriate structure of **C** which is produced from norvaline, use appropriate curly arrows to show how the **A** is formed at the anode. Show clearly the charges and lone pair of electrons as well as structure of intermediate formed. [2]

- (f) (i) The standard reduction potential of $\text{CO}_2/\text{CH}_3\text{OH}$ is +0.45 V, measured against the standard hydrogen electrode.

Write the ion-electron half reaction for the complete oxidation of methanol. [1]

- (ii) With reference to the reaction occurring at the anode for the electrolysis, suggest a suitable standard reduction potential value for (cation C)/(intermediate B) and explain your answer. [2]

- (a) The efficiency of the electrolysis reaction of compound A is around 95%.

A current of 0.1 A was applied to the electrolytic cell consisting of *N*-protected norvaline for 1 hour.

Calculate the mass of compound A produced at the anode when norvaline undergoes the electrolysis reaction. [M_r of A: 145.0] [2]

[Total: 22]

Section B

Answer **one** question from this section.

- 4 (a) An electrochemical cell consists of a half-cell containing $\text{Sn}^{4+}/\text{Sn}^{2+}$ and another half-cell containing Zn^{2+}/Zn .
- (i) Draw a fully labelled diagram of the experimental setup used to measure the standard potential of this cell. [2]
 - (ii) Use data from the Data Booklet to calculate a value for the standard cell potential. [1]
 - (iii) Explain how the cell potential will change when a small amount of sodium carbonate is added to the Zn^{2+}/Zn half-cell. [2]
 - (iv) Thermal decomposition of zinc carbonate is an endothermic reaction. Explain why the decomposition reaction is spontaneous at high temperature. [1]
 - (v) Using relevant data from the *Data Booklet*, explain the relative thermal stability of zinc carbonate and calcium carbonate. [2]

DO NOT WRITE IN THIS MARGIN

- (b) An oxide of tin, **G**, contains the metal in both oxidation states II and IV. **G** was dissolved in excess H_2SO_4 (aq) to produce solution **H**, which contains a mixture of tin(II) sulfate and tin(IV) sulfate. Solution **H** was divided into two portions.

A 25.0 cm^3 of one portion required 17.40 cm^3 of $0.0150 \text{ mol dm}^{-3}$ KMnO_4 to reach the end-point.

An excess of powdered zinc was added to another portion of **H**. The mixture was stirred until the reaction was complete, and then filtered. 25.0 cm^3 of the filtrate required 26.10 cm^3 of $0.0150 \text{ mol dm}^{-3}$ KMnO_4 to reach the end-point.

The equation for the titration reaction is as follows.

- (i) Deduce the $\text{Sn}^{2+}/\text{Sn}^{4+}$ ratio in the oxide **G**, and hence suggest the formula of **G**. [3]
- (ii) Tin(IV) oxide, SnO_2 , reacts separately with both acids and alkalis.

Write separate equations for the reaction of tin(IV) oxide with

- hydrochloric acid
- sodium hydroxide

[2]

- (c) Halogenoalkanes react with lithium to give organolithium compounds.

These organolithium compounds can react with carbonyl compounds to form alcohols, as shown in Fig. 4.1.

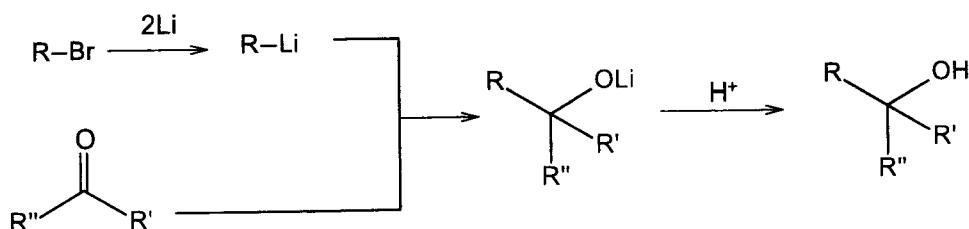

Fig. 4.1

(R is alkyl, R' and R'' are either alkyl or H)

- (i) Draw the skeletal formula of the organic product formed when bromoethane is reacted with lithium, followed by cyclopentanone in a similar synthetic route as shown in Fig. 4.1. [1]
- (ii) Compound J, $\text{C}_{10}\text{H}_{14}\text{NBr}$, decolourises aqueous bromine to give a white precipitate K, $\text{C}_{10}\text{H}_{12}\text{NBr}_3$.

J reacts with hot alcoholic NaOH to form isomers L and M, with the formula $\text{C}_{10}\text{H}_{13}\text{N}$. When heated with acidified KMnO_4 , L gives effervescence, whereas M gives N as one of the products. Reacting the N with bromomethane according to the sequence in Fig. 4.1 gives 2-methylpropan-2-ol.

Heating J gives P, $\text{C}_{10}\text{H}_{13}\text{N}$ as the organic product.

Suggest the possible structures of J, K, L, M and P. For each reaction, state the type of reaction described and explain what the information tells you about the functional groups present in each compound. [6]

- 5 (a) In 1944, T. Ellingham published plots of Gibbs free energy change, ΔG , against temperature, T , for several reactions. Today, such plots are called Ellingham diagrams.

At present, titanium is more commonly produced by reducing titanium tetrachloride with magnesium. Titanium tetrachloride is a colourless liquid that boils at 400 K. To optimise this reduction process, it is necessary to know how ΔG of the reaction changes with T .

Fig. 5.1 shows the variation in ΔG with T for the following reactions:

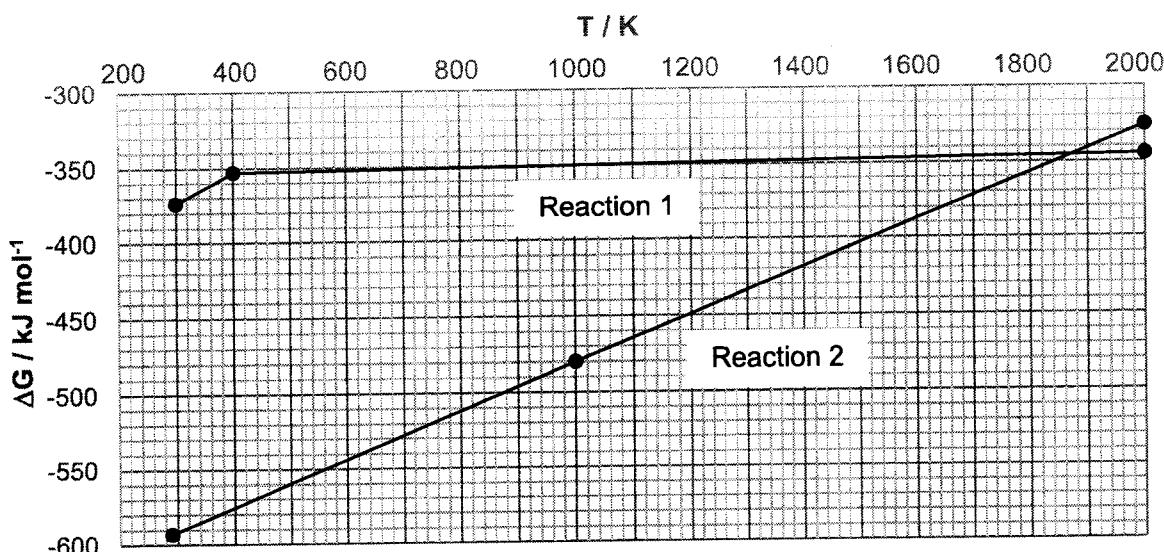

Fig. 5.1

- (i) With reference to the gradient of the graph for Reaction 2, deduce the sign of ΔS .

Hence, explain why the graph for Reaction 2 becomes more positive with increasing temperature. [2]

Industrially, the reduction of titanium tetrachloride by magnesium is carried out at 1100 K in an atmosphere of argon:

- (ii) Suggest a reason for the reduction to be carried out in an atmosphere of argon. [1]

Similar to enthalpy change of reaction, the Gibbs free energy, ΔG , of a reaction can be calculated using the following expression.

$$\Delta G = \sum \Delta G (\text{products}) - \sum \Delta G (\text{reactants})$$

With reference to Fig. 5.1,

- (iii) evaluate ΔG for the reduction of TiCl_4 by Mg at 1100 K. [1]

- (iv) state the temperature above which it is **not** feasible to reduce TiCl_4 with Mg. [1]

Paper 4 Practical

29 August 2022

2 hours 30 minutes

Candidates answer on the Question Paper.

READ THESE INSTRUCTIONS FIRST

Write your Civics Group and name on all the work you hand in.

Give details of the practical shift and laboratory where appropriate, in the boxes provided.

Write in dark blue or black pen.

You may use an HB pencil for any diagrams or graphs.

Do not use staples, paper clips, glue or correction fluid.

Answer **all** questions in the spaces provided on the Question Paper.

The use of an approved scientific calculator is expected, where appropriate.

You may lose marks if you do not show your working or if you do not use appropriate units.

Qualitative Analysis Notes are printed on pages 23 and 24.

At the end of the examination, fasten all your work securely together.

The number of marks is given in brackets [] at the end of each question or part question.

This document consists of **23** printed pages and **1** blank page.

Answer all the questions in the spaces provided.

1 Determination of the percentage by mass of water of crystallisation in $\text{FeSO}_4 \cdot n\text{H}_2\text{O}$

Read through the whole method before starting any practical work. Where appropriate, prepare a table for your results in the space provided.

Show your working and appropriate significant figures in the final answer to each step of your calculations.

The amount of Fe^{2+} ions can be determined quantitatively by a titration against a standard solution of potassium manganate(VII), KMnO_4 . The reaction is shown below.

In this experiment, you will determine the percentage by mass of water of crystallisation in $\text{FeSO}_4 \cdot n\text{H}_2\text{O}$. You will titrate a solution of **FA 1** against **FA 3**.

You are provided with

FA 1, contains 26.07 g dm^{-3} of hydrated iron(II) sulfate, $\text{FeSO}_4 \cdot n\text{H}_2\text{O}$, where n is an integer.

FA 2, 1.0 mol dm^{-3} dilute sulfuric acid, H_2SO_4

FA 3, 0.0200 mol dm^{-3} potassium manganate(VII), KMnO_4

You are to keep **FA 2** and **FA 3** for questions 2 and 3.

(a) (i) Titration of FA 1 against FA 3

1. Fill a burette, labelled **FA 3**, with **FA 3**.
2. Use a pipette to transfer 10.0 cm^3 of **FA 1** into a 250 cm^3 conical flask.
3. Use a measuring cylinder to add about 10 cm^3 of **FA 2** to this flask.
4. Titrate **FA 1** with **FA 3** from the burette until the appearance of the first permanent pale-pink colour.
5. Record your titration results, to an appropriate level of precision, in the space on **Page 3**.
6. Repeat steps 1 to 4 until consistent results are obtained.

Titration Results

[2]

- (ii) From your titrations, obtain a suitable volume of **FA 3** to be used in your calculations. Show clearly how you obtained this volume.

DO NOT WRITE IN THIS MARGIN

[Total: 12]

2 To investigate the reaction between manganate(VII) ions and $\text{C}_2\text{O}_4^{2-}$ ions

In this experiment, you will investigate the kinetics of the reaction between MnO_4^- and $\text{C}_2\text{O}_4^{2-}$.

FA 4 is $0.0100 \text{ mol dm}^{-3}$ sodium thiosulfate, $\text{Na}_2\text{S}_2\text{O}_3$

FA 5 is $0.200 \text{ mol dm}^{-3}$ sodium ethanedioate, $\text{Na}_2\text{C}_2\text{O}_4$

FA 6 is $0.100 \text{ mol dm}^{-3}$ potassium iodide, KI

FA 2 and **FA 3** are solutions from question 1.

You are to keep **FA 5** for question 3.

You are also provided with a starch indicator.

Acidified potassium manganate(VII) ions oxidises $\text{C}_2\text{O}_4^{2-}$ ions to produce Mn^{2+} ions which act as an autocatalyst for the reaction.

Acidified potassium manganate(VII) ions also oxidises I^- ions according to the following reaction:

You will add a solution of acidified potassium manganate(VII) to a mixture containing **FA 2** and **FA 5**. At timed intervals, you will draw 10 cm^3 aliquots of the reaction mixture. The concentration of MnO_4^- ions in each aliquot will be determined after adding the aliquot to an excess of I^- solution and titrating the iodine produced against $\text{S}_2\text{O}_3^{2-}$ solution.

The reaction between iodine from the reaction mixture and $\text{S}_2\text{O}_3^{2-}$ solution is given below.

Note: $\text{C}_2\text{O}_4^{2-}$ does not react with I^- in the reaction mixture.

DO NOT WRITE IN THIS MARGIN

DO NOT WRITE IN THIS MARGIN

Question 2 continues on the next page.

Note: Read all instructions in the procedure before you start performing the experiment.

Recording your results

In an appropriate format in the space provided on **page 9**, draw a table to record your

- transfer time (in minutes and seconds, to the nearest second) when half of the reaction mixture has emptied from the pipette,
- the decimal time, t_d , in minutes, to 0.1 min, for example, if $t = 3 \text{ min } 20 \text{ s}$ then $t_d = 3 \text{ min } + 20/60 = 3.3 \text{ min}$,
- titration results for each of your aliquots. Make certain that your recorded results show the precision of your working.

Procedure

1. Label each of the large test-tubes **1** to **6**. Using a measuring cylinder, add approximately 10 cm^3 of **FA 6** to each of these test-tubes.
2. Using appropriate measuring cylinders, transfer 50.0 cm^3 of **FA 5**, 5.0 cm^3 of **FA 2** and 45.0 cm^3 of deionised water into a conical flask labelled **reaction mixture**.
3. Using an appropriate measuring cylinder, transfer 25.0 cm^3 of **FA 3** to the conical flask labelled **reaction mixture**. Start the stopwatch and swirl the mixture thoroughly to mix its contents.
4. At approximately 1 minute, use a 10 cm^3 pipette to remove a 10.0 cm^3 aliquot of the reaction mixture. **Immediately** transfer this aliquot into the test-tube labelled **1** and swirl the mixture. Note and record the transfer time (in minutes and seconds, to the nearest second) when half of the reaction mixture has emptied from the pipette.
5. At approximately 2 minutes, repeat step 4. Transfer this aliquot into the large test-tube labelled **2**.
6. Repeat step 4 four more times at about three minute intervals, transferring the aliquots into test-tubes labelled **3** to **6**.

Titrations

Note: You will only be able to perform each titration **once**. Be careful not to overshoot the end-point. Performing all of the titrations only after all the aliquots have been collected may affect time management.

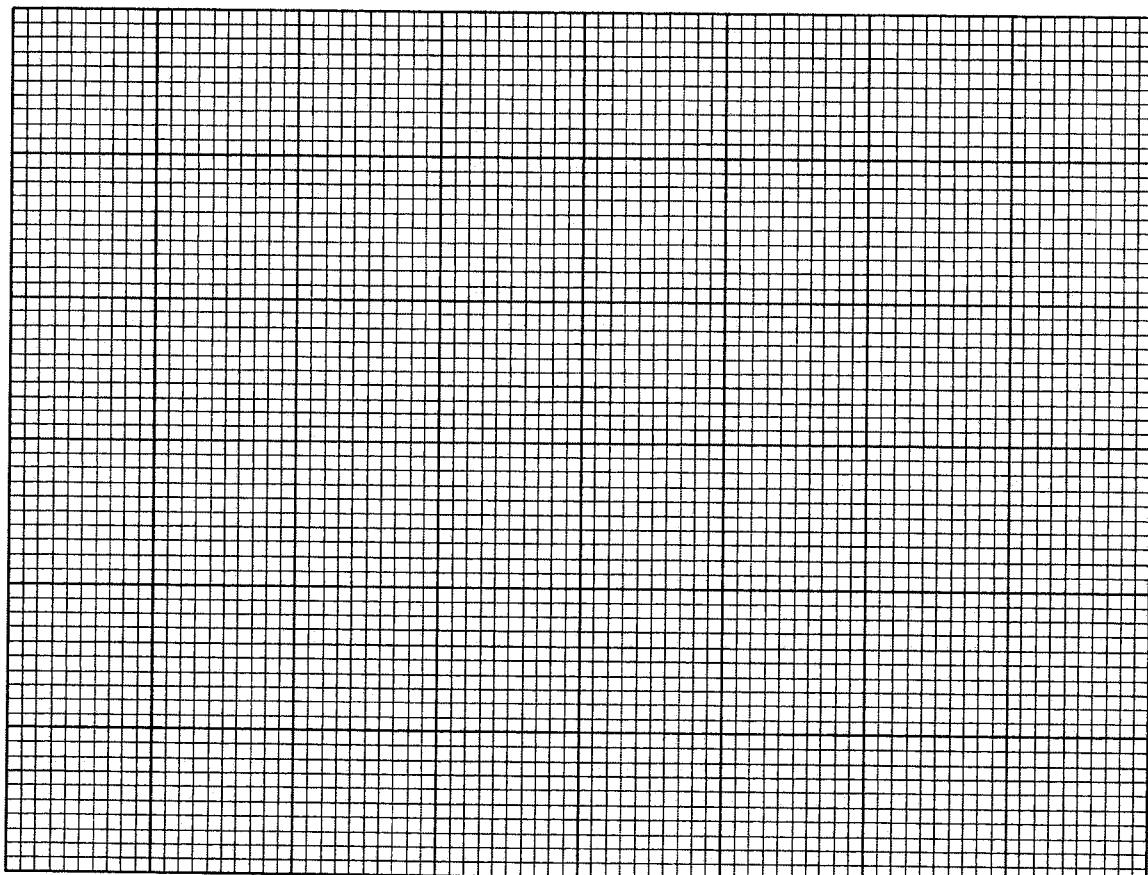

7. Pour the contents of test-tube labelled **1** into a clean 250 cm^3 conical flask. Rinse the test-tube and add the washings to the conical flask.
8. Titrate the iodine in this solution with **FA 4**. When the colour of the solution turns pale yellow, add about 1 cm^3 of starch indicator. The solution will turn dark blue/black. The end-point is reached when the dark blue/black colour just disappears. Record your results.
9. Repeat steps **8** to **9** for each of the remaining test-tubes labelled **2** to **6**.

(a) Experimental results

[3]

- (b) (i) On the grid in Fig. 2.1, plot a graph of **volume of sodium thiosulfate, FA 4**, on the **y-axis**, against time, t_d , on the **x-axis**. You should draw the most suitable line that takes into account all of your plotted points.

4 Planning

You are to plan an experiment to determine the concentration of a solution of $\text{H}_2\text{C}_2\text{O}_4$ and the ΔH_{neut} between ethanedioic acid and sodium hydroxide.

You are provided with 2.00 mol dm⁻³ NaOH and a solution of $\text{H}_2\text{C}_2\text{O}_4$ of approximately the same concentration. A series of experiments can be carried out using different volumes of the two solutions. In each experiment, the total volume of the two solutions is to be kept at 50 cm³ and the increase in temperature, ΔT , is determined.

A graph of ΔT against *volume of $\text{H}_2\text{C}_2\text{O}_4$* can then be used to determine the exact concentration of the $\text{H}_2\text{C}_2\text{O}_4$ solution and ΔH_{neut} .

- (a) Determine the volume of $\text{H}_2\text{C}_2\text{O}_4$ and of NaOH to be used such that both solutions will react completely. Show your working clearly and give your answers to the **nearest whole number**.

[1]

- (b) Plan a procedure to collect sufficient data to allow a graph of ΔT against volume of $H_2C_2O_4$ to be drawn.

You are provided with:

- 2.00 mol dm^{-3} NaOH,
- $H_2C_2O_4$ solution of approximately the same concentration,
- the equipment normally found in a school laboratory.

In your plan, you should include the following:

- the procedure, including the apparatus you would use
- a tabulation of the experimental data to be collected, including the volumes of $H_2C_2O_4$ and NaOH

You may assume that the $H_2C_2O_4$ and NaOH solutions have the same initial temperature.
